CAPSTONE PROJECT SHOWCASE

Project Title

**Voting Application using Django Framework-
swetha-(4049,SEC)**

Abstract | Problem Statement | Project Overview | Proposed Solution |
Technology Used | Modelling & Results | Conclusion

Abstract : Django Online Voting System

Casting a ballot is a fundamental concept in our democratic structure. We consider voting to be one of the most essential rights in our society. The proposed **e-voting system** facilitates users in making their choices without physically visiting polling stations. This system leverages the power of the internet to enable eligible voters to cast their votes remotely.

Problem Statement

- ✓ The primary objective of the **Python Django online voting system** is to provide a convenient and efficient method for eligible voters to cast their votes using the internet.
- ✓ Voters can access the voting process through a secure website or a dedicated voting application.
- ✓ Aim to build a web application that facilitate voting on various questions . User can select their preferred choice for each question and t6he system will calculate and display the total votes

Proposed Solution

1. Project Setup:

- Start a new Django project: **django-admin startproject voting_app**.
- Create a new Django app for the voting functionality: **python manage.py startapp vote**.

2. Models:

- Define models for your voting system. For example, you might have a **Poll** model to represent each poll and a **Choice** model to represent the choices for each poll.

Front-end

Back-end

The screenshot shows a web browser window with a purple header and a white main content area. The browser's address bar shows the URL "127.0.0.1:8000/polls/4/". The page has a navigation bar with links for "Home", "Features", "Pricing", and "Disabled". A "Back To Polls" button is located below the navigation bar. The main content area displays the question "which job you prefer for?" and three radio button options: "software engineering" (selected), "construction work", and "highway manufacturing". A large green "Vote" button is positioned at the bottom of the form.

The screenshot shows a web browser window with a purple theme. The address bar displays the URL `127.0.0.1:8000/polls/2/results/`. Below the address bar is a navigation bar with links: [Navbar](#), [Home](#), [Features](#), [Pricing](#), and [Disabled](#). The main content area displays the poll question "which is your favourite food?". Below the question is a table with three rows, each representing a food item and its vote count. The first row is "Briyani" with "1 vote". The second row is "chappathi" with "0 votes". The third row is "curdrice" with "0 votes". At the bottom of the page, there are two buttons: "Back To Polls" and "Vote again?".

which is your favourite food?	
Briyani	1 vote
chappathi	0 votes
curdrice	0 votes

Conclusion

In conclusion, the Django polling application offers a comprehensive solution for conducting polls with various advanced features to enhance user experience and functionality. By leveraging Django's powerful framework, along with modern frontend technologies and third-party services, we've created a robust platform for managing polls and engaging users.

Real-time updates are facilitated through WebSockets or server-sent events, providing users with instant feedback on poll results without requiring page refreshes.

Thank You!
